

# Boston University

## CAS CS 640: AI

1<sup>st</sup> & 1/2 Lecture on Computer Vision  
by Margrit Betke  
October 12 & 17, 2023

# Learning Objectives for this Lecture

Computer Science

- ❑ Understand formats of images used as inputs to AI models: greyscale, color, medical scans
- ❑ Understand differences and similarities between pre-2012 “traditional computer vision” and post-2012 neural-network-based computer vision & see examples
- ❑ Understand why convolution is powerful
- ❑ Understand how tools from estimation theory can be used to measure recognizability of objects in images
- ❑ Learn about breakthrough dataset ImageNet
- ❑ Learn about early CNNs used in computer vision

# What is an image?

Computer Science

- ❑ Images are fields of colored dots
- ❑ Each dot is called a pixel =picture cell
- ❑ Standard test image with detail, shading, texture, sharp & blurry regions:

Lena Soderberg '72  
(controversy!)

# Color Models

Computer Science

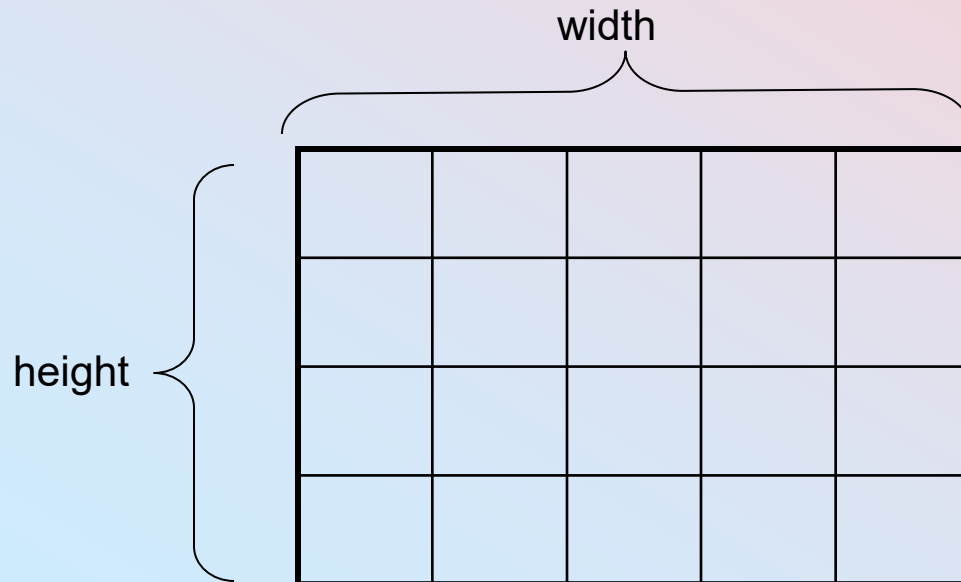

- ❑ Images can be gray scale, color, or color with an alpha (transparency) channel
- ❑ Most common color representation is RGB (Red, Green, Blue). This is the representation used to put pixels on the screen
- ❑ Other models include CMYK (used for print) and YUV (often used for input from cameras, compression, and transmission)

# What is an image?

Computer Science

- ❑ Images are 2 dimensional arrays of data, with an associated width, height, and color depth.
- ❑ Images typically use one byte per color channel per pixel.
- ❑ Gray images have 1 color channel. RGB images have 3 color channels. RGBA images have 4 color channels.

Slide credit: Diane Theriault

# Digital Image File Formats

Computer Science

Image:

Size of table, color, compression scheme

Gray-scale images: generally 1 byte per pixel

Color images: 3 numbers (each 1 byte) per pixel

Medical images, e.g., CT, MRI:  
typically 2 bytes per voxel

# Example: PGM Image

## Image

# How do I get at the data?

Computer Science

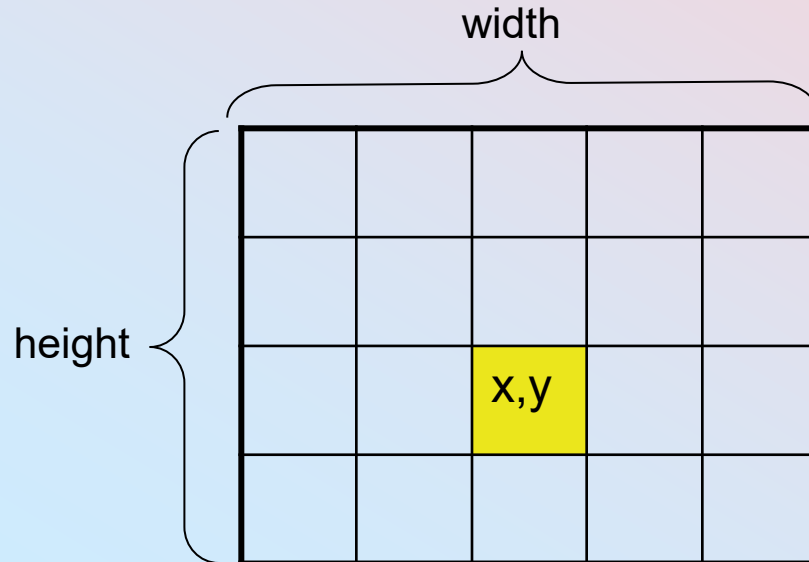

- ❑ Some image-handling APIs have nice interfaces, but speed can be a problem.
- ❑ You will probably have to handle the bytes of data directly at some point

# How do I get at the data?

Computer Science

- ❑ X = desired row
- ❑ Y = desired column
- ❑ C = color channel (red, green, blue, ...).
- ❑ Bpp= Bytes per pixel (color channels)
- ❑ Image data is normally stored in row major order
- ❑ Note that there may be multiple values associated with each x,y pixel
- ❑  $\text{Data}(x,y,c) = y * (\text{width} * \text{Bpp}) + x * \text{Bpp} + c$

Slide credit: Diane Theriault

# Example of a “Traditional” Computer Vision Algorithm: Color to Gray Scale Conversion

Computer Science

- ❑ Pre-NN-revolution Computer Vision: Algorithms
- ❑ Example of such a pre-2012 algorithm:
  - Converting from color to gray scale,  
a very common operation

# Color-to-Grayscale Conversion

Computer Science

- ❑ “Quick and dirty” conversion: Grab the Green Channel
- ❑ Average R, G, B:  $(R+G+B)/3$
- ❑  $\text{Max}(R, G, B)$
- ❑ Weigh them:  $0.3*R + 0.6*G + 0.1*B$

Slide credit: Diane Theriault

# Image File Formats

Computer Science

- ❑ PPM / PGM is the simplest file format ever, but not supported by Photoshop or MS Image Viewer. Uncompressed.
- ❑ BMP: Microsoft's uncompressed image format
- ❑ GIF: Images are compressed using run-length encoding, and reducing the number of colors used. Licensed, not open
- ❑ JPEG: Images are compressed by throwing away high frequency information

# Tools of the Trade

Computer Science

- ❑ OpenCV is a widely used, open-source computer vision library maintained by Intel
- ❑ Provides libraries for image I/O, movie I/O and camera capture
- ❑ Industrial strength computer vision and image processing implementations
- ❑ Quick and dirty GUI toolkit

# Tools of the Trade

Computer Science

- ❑ Irfanview is a freely available image viewer and possibly one of the most useful programs ever.

# Common Gotcha's

Computer Science

- ❑ Sometimes the mapping from a weird looking image to the actual error is not obvious

# Common Gotcha's Color Order

Computer Science

## □ RGB vs. BGR

Slide credit: Diane Theriault

# Common Gotcha's Wrong Width

Computer Science

- ❑ Incorrect width can result in an image with strong diagonal structure

Actual width: 512

This image  
width: 508

Slide credit: Diane Theriault

# Common Gotcha's Wrong Color Depth

Computer Science

- ❑ Mismatched color depth can result in an image with a rainbow effect

Slide credit: Diane Theriault

# Common Gotcha's Windows line endings

Computer Science

- ❑ On Windows, it is critically important to open image files in binary mode.
- ❑ Otherwise, windows helpfully strips out any bytes with value '\r' (20).

Slide credit: Diane Theriault

# Today's Computer Vision: Mostly Neural Networks

Computer Science

- ❑ Deep neural networks
  - ❑ Convolutional neural networks
  - ❑ Transformers
  - ❑ Diffusion models
- + traditional computer vision algorithms,  
representations, geometry, and tricks
- ❑ In CS 640: Both traditional & NN Computer Vision

# 1D Discrete Convolution

Computer Science

1D Convolution:

Time signal  $f$  and shifted time signal  $g$  are multiplied and added:

$$\begin{aligned}(f * g)[n] &\stackrel{\text{def}}{=} \sum_{m=-\infty}^{\infty} f[m] g[n - m] \\ &= \sum_{m=-\infty}^{\infty} f[n - m] g[m].\end{aligned}$$

2D generalization:

$f$  = input image,  $g$  = template image  
(or CNN function)

# 2D Convolution Example

Computer Science

1 <sub>x1</sub>	1 <sub>x0</sub>	1 <sub>x1</sub>	0	0
0 <sub>x0</sub>	1 <sub>x1</sub>	1 <sub>x0</sub>	1	0
0 <sub>x1</sub>	0 <sub>x0</sub>	1 <sub>x1</sub>	1	1
0	0	1	1	0
0	1	1	0	0

Image

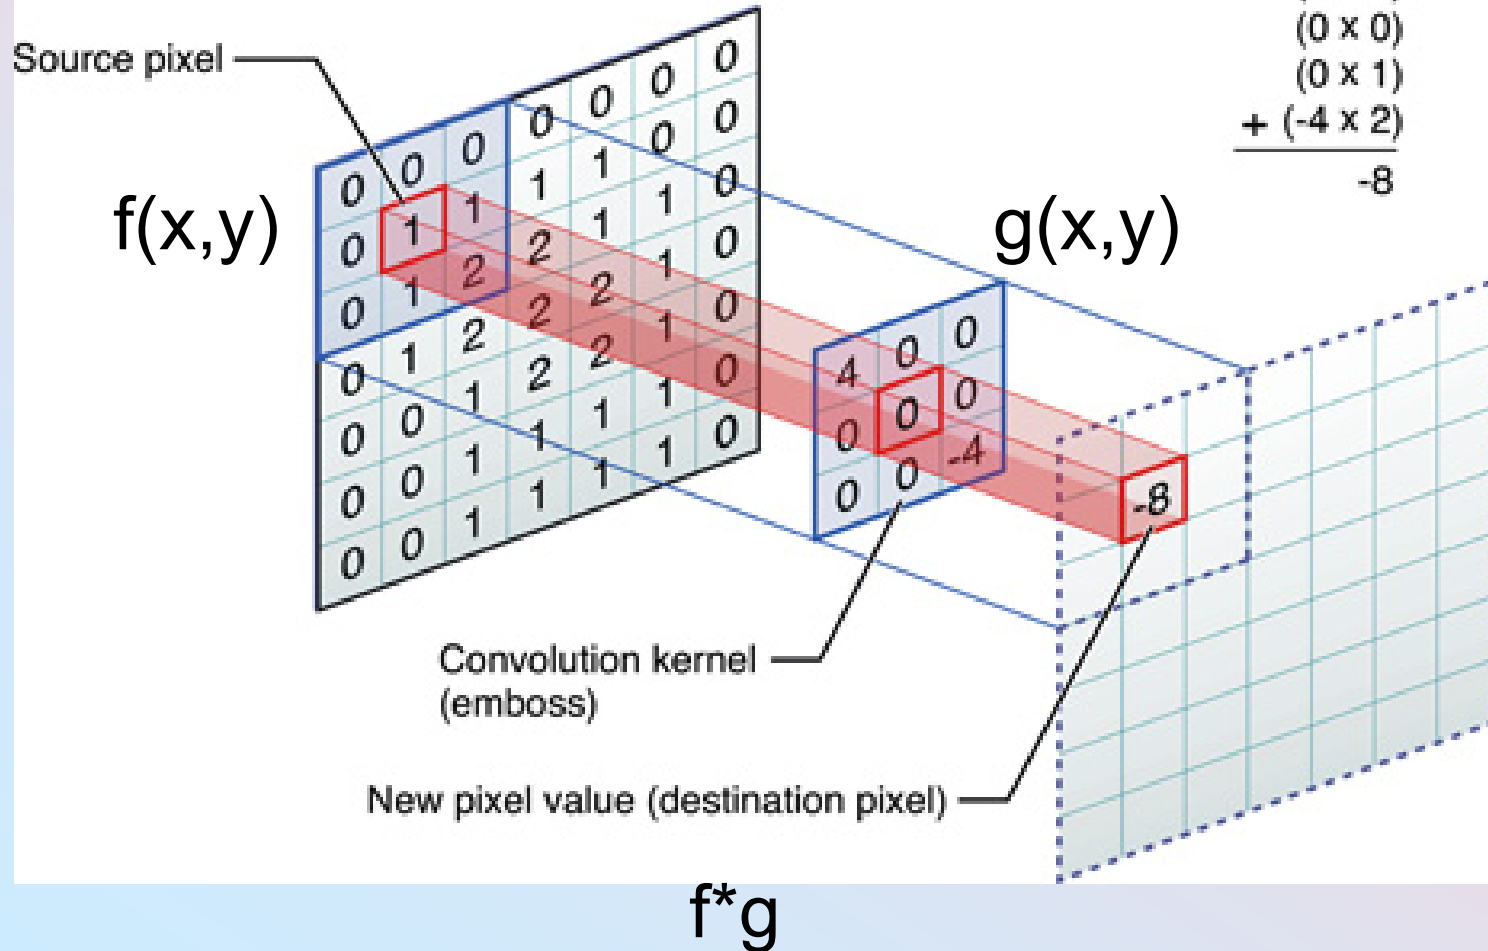

4		

Convolved  
Feature

Center element of the kernel is placed over the source pixel. The source pixel is then replaced with a weighted sum of itself and nearby pixels.

$$\begin{array}{r}
 (4 \times 0) \\
 (0 \times 0) \\
 (0 \times 0) \\
 (0 \times 0) \\
 (0 \times 1) \\
 (0 \times 1) \\
 (0 \times 0) \\
 (0 \times 1) \\

Nonzero-mean Background

Scene with Object

Norm. Correlation Coefficient

= convolution/std-devs

# 2D Position Estimation

Convolution of one-way sign with itself

# 2 D Position Estimation

Convolution of one-way sign with scene  
(NCC)

Peak in  
performance surface  
(= negative loss fct)  
at correct location

# 2 D Position Estimation

Convolution of one-way sign with scene (NCC)

This performance surface is computed for **correct** size of one-way sign

Different surfaces for different sizes of object

# Sample Performance Surfaces

complexity: 250  
size:  $73 \times 27$   
max. cor. coef. 0.82  
**correct match**

complexity: 33  
size:  $73 \times 27$   
max. cor. coef. 0.64  
**incorrect match**

(shown enlarged)  
complexity: 25  
size:  $21 \times 5$   
max. cor. coef. 0.70  
**incorrect match**

# Multi-Resolution Matching

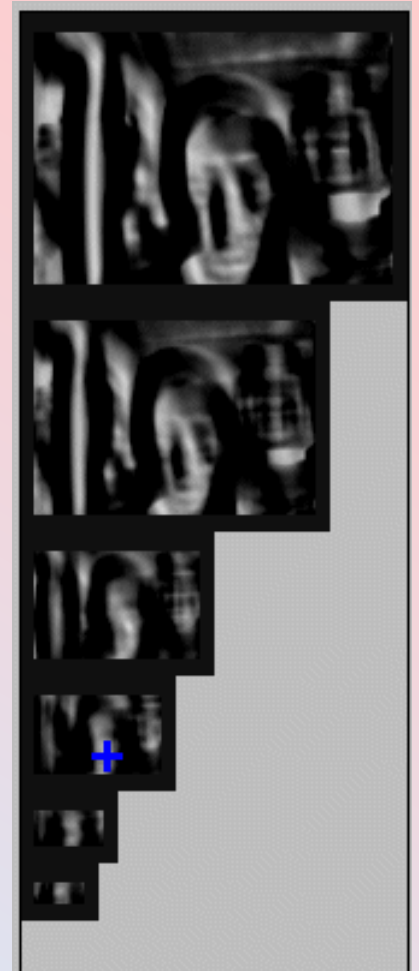

Computer Science

Normalized correlation coefficient over multi-resolution search space:

$$r = \frac{1/n \sum_i (s_i - \text{mean}(s)) (m_i - \text{mean}(m))}{(\sigma_s \sigma_m)}$$

← Template  
matched over all  
resolutions →

# Finding the Face and its Movement by Locating the Best Match of a Face Template

Computer Science

(a) Input

You can apply template matching to a small version of your input image and use that search result to start searching for a match in the 2<sup>nd</sup> smallest images. Repeat until the original size is processed.

(d) Correlation

# Object Recognition = Parameter Estimation

Affine parameterization  $\mathbf{x}' = \mathbf{A}\mathbf{x} + \mathbf{b} \Rightarrow$  estimate  $\mathbf{a}$

Likelihood function

$$P(\mathbf{I}|\mathbf{a}) = \frac{1}{(2\pi\sigma^2)^{\frac{NM}{2}}} \exp\left(-\frac{1}{2\sigma^2} \sum_{k=1}^{MN} (I_k - m_k(\mathbf{a}))^2\right)$$

CR lower bound

$$E[(\hat{\mathbf{a}} - \mathbf{a})(\hat{\mathbf{a}} - \mathbf{a})^T] \geq \mathbf{J}^{-1}$$

# Fisher Information

$a_4 = s$

$$J_{ij} = \frac{1}{\sigma^2} \sum_x \sum_y \left( \frac{\partial m(x, y, \mathbf{a})}{\partial a_i} \frac{\partial m(x, y, \mathbf{a})}{\partial a_j} \right)$$

$a_1 = x$

$a_2 = y$

$a_3 = \theta$

# Object Coherence

Computer Science

$$\text{CRLB: } E[(\hat{a}_i - a_i)^2] \geq [\mathbf{J}^{-1}]_{ii} = \frac{\sigma^2}{E} \ell_i^2$$

$$\text{Energy: } E = \sum_{(x,y) \in O} |m(x, y; \mathbf{a})|^2$$

Coherence scale and volume:

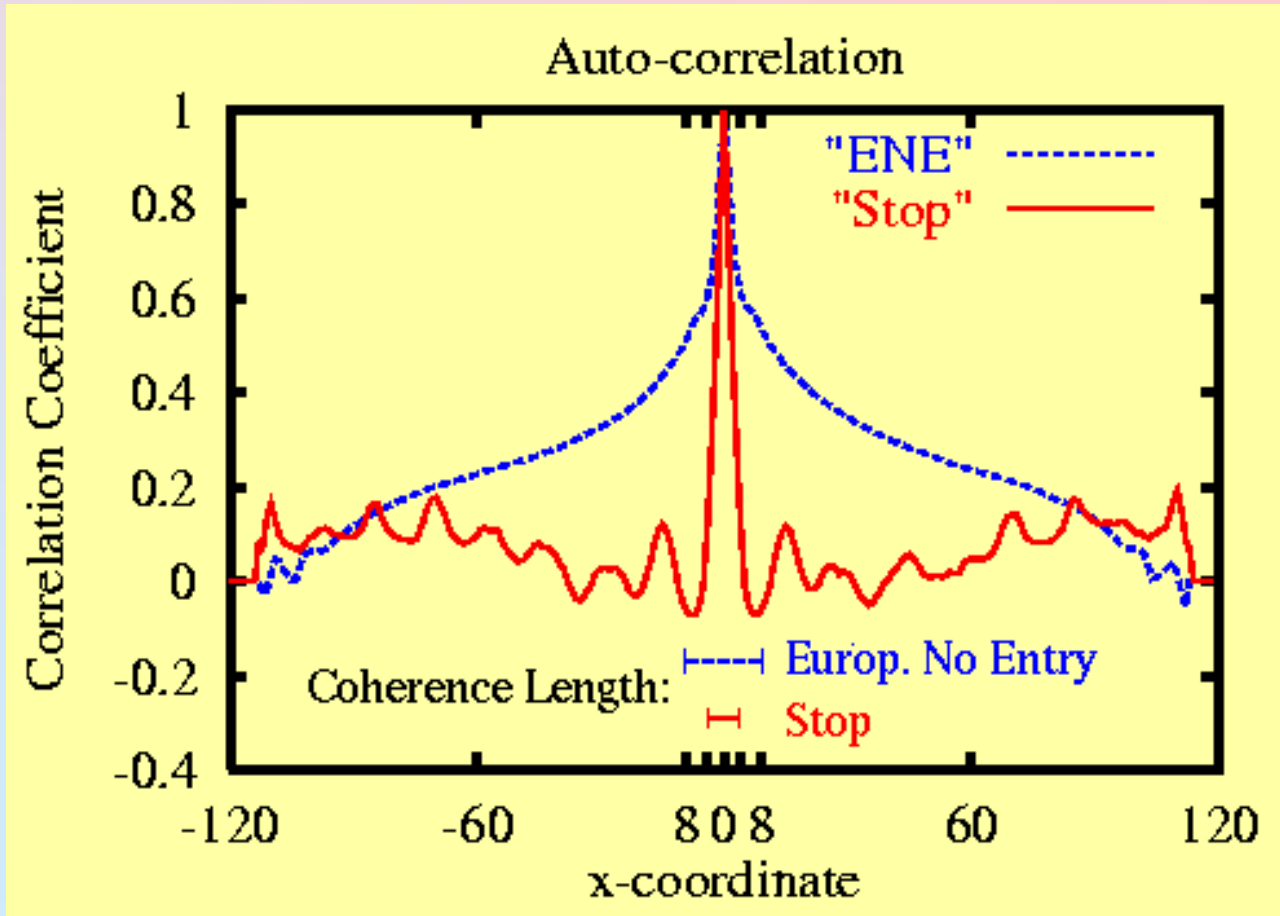

$$\ell_i = \left( [\mathbf{J}^{-1}]_{ii} \frac{E}{\sigma^2} \right)^{\frac{1}{2}}$$

$$V = \left( \frac{E}{\sigma^2} \right)^{\frac{n_a}{2}} |\mathbf{J}|^{-\frac{1}{2}}$$

# Coherence Length Scale

Computer Science

Since coherence length of Stop sign  $<$  No-Entry Sign, resolving location (x-coordinate) of Stop sign is easier

# Coherence Area

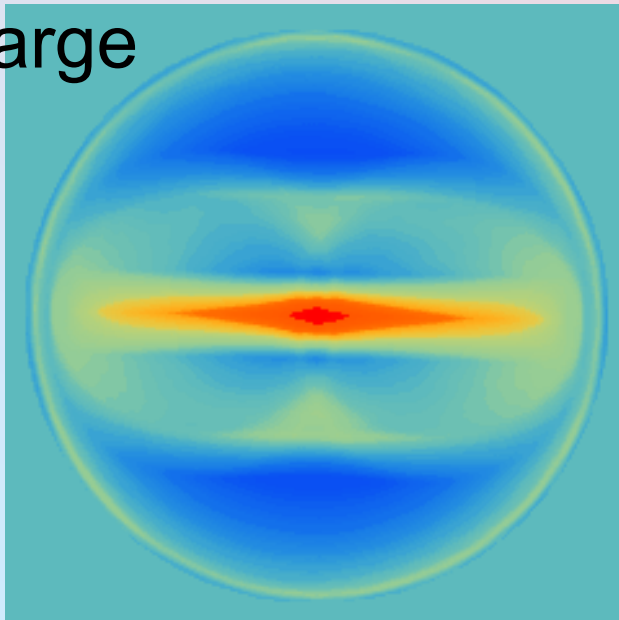

Computer Science

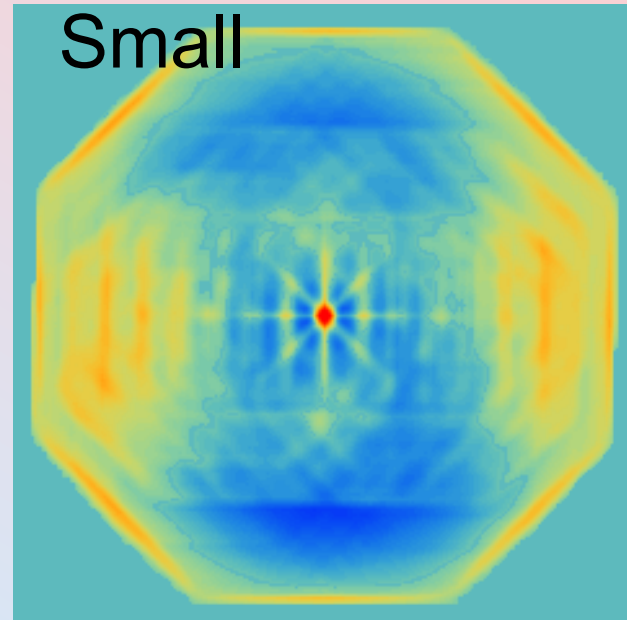

Betke, Makris,  
IJCV 2001

Large

Small

Resolving  $(x,y)$  location is easier for Stop sign

# Angular Coherence Scale

Computer Science

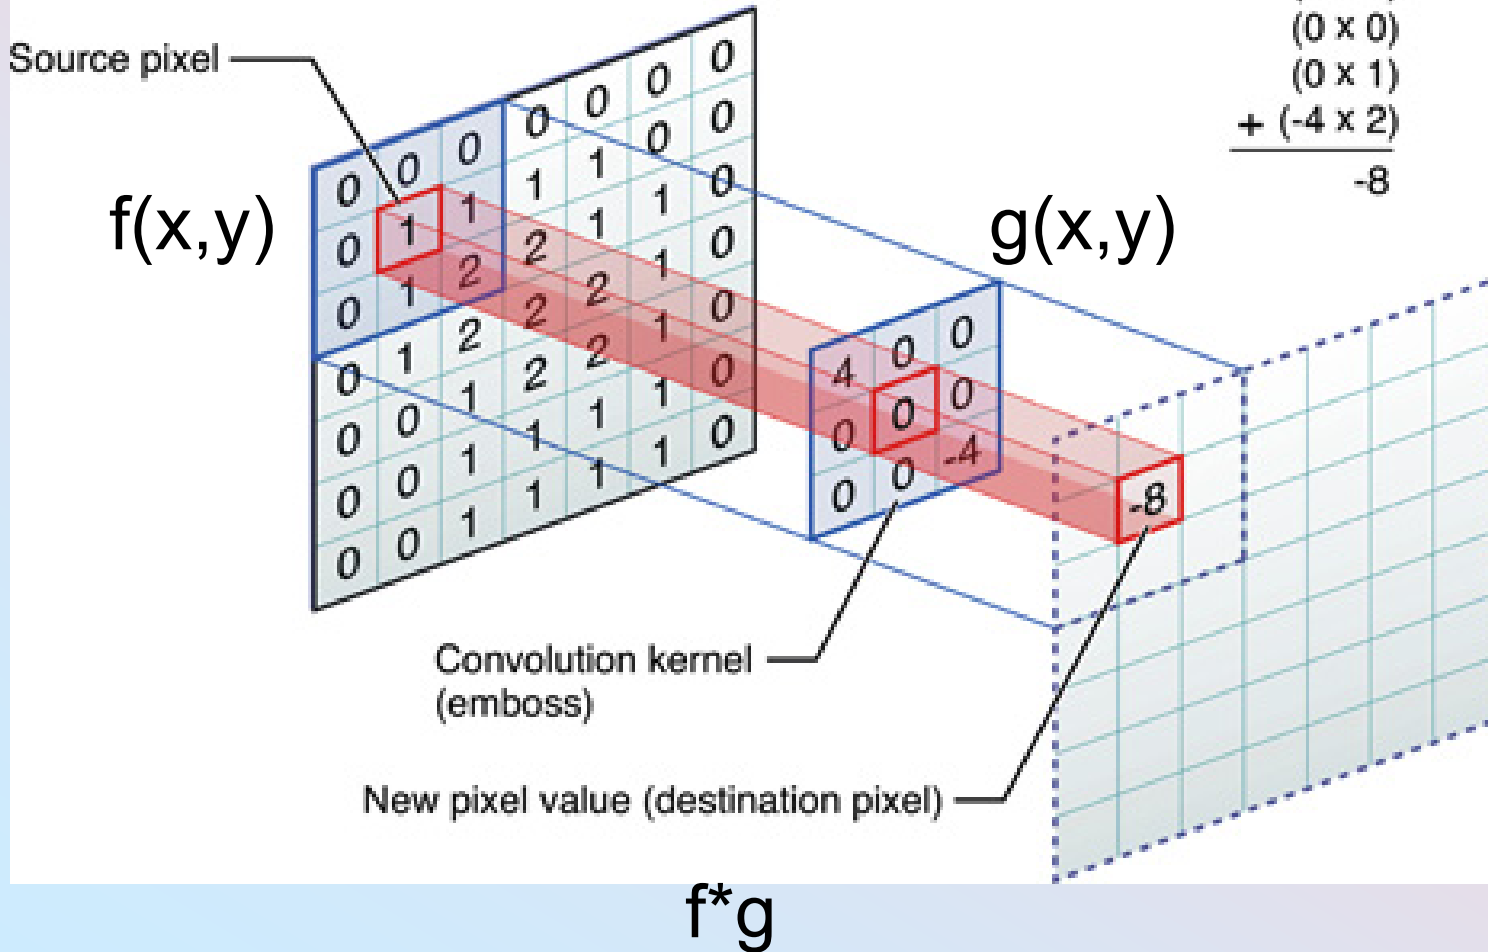

Peaks at  $\sim 45, 90, \dots$  degrees

Betke, Makris,  
IJCV 2001

Center element of the kernel is placed over the source pixel. The source pixel is then replaced with a weighted sum of itself and nearby pixels.

$$\begin{array}{r} (4 \times 0) \\ (0 \times 0) \\ (0 \times 0) \\ (0 \times 0) \\ (0 \times 1) \\ (0 \times 1) \\ (0 \times 0) \\ (0 \times 1) \\ + (-4 \times 2) \\ \hline -8 \end{array}$$

# Conclusions on Coherence

Computer Science

- ❑ Using the Fisher Information matrix, we can compute the coherence scales of objects
- ❑ Coherence scales define the recognizability of object parameters
- ❑ Intuitively, coherence areas = “cells” = “interconnected parts” = “degrees of freedom”
- ❑ Coherence scales can be visualized with autocorrelations, i.e., “object convolution with itself”
- ❑ Neural nets compute many convolutions and memorize coherence scales of objects

# The CNN Explainer

Thanks to CS640  
classmate Mao Mao,  
we have a link to the  
*CNN Explainer*:

<https://poloclub.github.io/cnn-explainer/>

by Jay Wang, Robert Turko, Omar Shaikh, Haekyu Park, Nilaksh Das, Fred Hohman, Minsuk Kahng, and Polo Chau, a result of a research collaboration between Georgia Tech and Oregon State University

# ImageNet –

## The Data Set that Mattered and Still Matters!

[Deng et al. CVPR 2009]

- 14 million labeled images
- 20 thousand object classes
- Images collected from the Internet
- Human labels obtained by crowdsourcing with Amazon Turk
- Still very important in 2023 because it is used for pretraining of “backbone neural nets”

# Analysis of Large Scale Visual Recognition

# SuperVision = AlexNet

Alex Krizhevsky, Ilya Sutskever, Geoffrey Hinton (Krizhevsky NIPS12)

**Image classification:** Deep convolutional neural networks

- 7 hidden “weight” layers, 650K neurons, 60M parameters, 630M connections
- Rectified Linear Units, max pooling, dropout trick
- Randomly extracted 224x224 patches for more data
- Trained with Stochastic Gradient Descent on two GPUs for a week, fully supervised (50x speed-up over CPU)

**Localization:** Regression on  $(x,y,w,h)$

<http://www.cs.toronto.edu/~fritz/absps/imagenet.pdf>

# AlexNet

- Similar to the model proposed by LeCun in 1998 but:
  - Larger model (7 hidden layers, 650,000 units, 60,000,000 params)
  - More data ( $10^6$  vs.  $10^3$  images)

A. Krizhevsky, I. Sutskever, and G. Hinton,

[ImageNet Classification with Deep Convolutional Neural Networks](#), NIPS 2012

# Details of the Oxford VGG

This is **not** the neural net VGG but uses traditional computer vision techniques!

Karen Simonyan, Yusuf Aytar, Andrea Vedaldi, Andrew Zisserman

**Image classification:** Fisher vector + linear SVM (Sanchez CVPR11)

- Root-SIFT (Arandjelovic CVPR12), color statistics, augmentation with patch location (x,y) (Sanchez PRL12)
- Fisher vectors: 1024 Gaussians, 135K dimensions
- No SPM, product quantization to compress
- Semi-supervised learning to find additional bounding boxes
- 1000 one-vs-rest SVM trained with Pegasos SGD
  - 135M parameters!

**Localization:** Deformable part-based models (Felzenszwalb PAMI10), without parts (root-only)

[http://image-net.org/challenges/LSVRC/2012/oxford\\_vgg.pdf](http://image-net.org/challenges/LSVRC/2012/oxford_vgg.pdf)

# Results on ILSVRC-500

Preliminaries:

- ILSVRC-500 (2012) dataset – similar to PASCAL
- Leading algorithms: Alex Net and VGG

## What happens under the hood on **classification+localization**?

- Alex Net always great at classification, but VGG does better than Alex Net localizing small objects
- A closer look at textured objects

Olga Russakovsky, Jia Deng, Zhiheng Huang, Alex Berg, Li Fei-Fei

# ImageNet Classification Challenge

# Recap of NN-based Computer Vision

## ❑ Neural networks

- View of neural networks as learning hierarchy of features

## ❑ Convolutional neural networks

- Architecture of network accounts for image structure
- “End-to-end” recognition from pixels
- Together with large labeled datasets and lots of computation → major success on benchmark ImageNet, i.e., object classification and localization

# Learning Objectives for this Lecture

Computer Science

- ❑ Understand formats of images used as inputs to AI models: greyscale, color, medical scans
- ❑ Understand differences and similarities between pre-2012 “traditional computer vision” and post-2012 neural-network-based computer vision & see examples
- ❑ Understand why convolution is powerful
- ❑ Understand how tools from estimation theory can be used to measure recognizability of objects in images
- ❑ Learn about breakthrough dataset ImageNet
- ❑ Learn about early CNNs used in computer vision
