

## Examples of Typing Derivations

in a “Mini-Haskell” where the only available types are `Int` and `Bool`

Assaf Kfoury

1 November 2016

This document is best read on a monitor screen, using a previewer (ghostscript for ps, acroread for pdf). If you print it out, which you can of course, it will not give you the effect of the overlay pages.

**Example 1:** \ f -> (+) (f 5) 10

Running a Haskell interpreter confirms that the expression is well-formed and that the following type is valid for it (there are other valid types for it in full Haskell):  $(\text{Int} \rightarrow \text{Int}) \rightarrow \text{Int}$ .

**Example 1:**  $\backslash f \rightarrow (f\ 5) + 10$

Running a Haskell interpreter confirms that the expression is well-formed and that the following type is valid for it (there are other valid types for it in full Haskell):  $(Int \rightarrow Int) \rightarrow Int$ .

- |    |       |                       |   |               |
|----|-------|-----------------------|---|---------------|
| 1. | $f :$ | $Int \rightarrow Int$ | $\vdash f : Int \rightarrow Int$  | VAR           |
| 2. | $f :$ | $Int \rightarrow Int$ | $\vdash 5 : Int$  | INT           |
| 3. | $f :$ | $Int \rightarrow Int$ | $\vdash f\ 5 : Int$   | APP from 1, 2 |
| 4. | $f :$ | $Int \rightarrow Int$ | $\vdash 10 : Int$   | INT           |
| 5. | $f :$ | $Int \rightarrow Int$ | $\vdash (f\ 5) + 10 : Int$  | ADD from 3, 4 |
| 6. |       |                       | $\vdash \backslash f \rightarrow (f\ 5) + 10 : (Int \rightarrow Int) \rightarrow Int$ | ABS from 5    |

**Example 2:**  $\text{let } f = (\lambda x \rightarrow x) \text{ in } f (f 5)$

This expression is well-formed. This is confirmed by running a Haskell interpreter on the expression, with `Int` as the final type assigned to it.

First, we show the skeleton of the typing derivation we want, i.e., the derivation without any types.

1.	$\vdash f$	VAR
2.	$\vdash 5$	INT
3.	$\vdash f\ 5$	APP from 1, 2
4.	$\vdash f$	VAR
5.	$\vdash f\ (f\ 5)$	APP from 3, 4
6.	$\vdash x$	VAR
7.	$\vdash \lambda x \rightarrow x$	ABS from 6
8.	$\vdash \text{let } f = (\lambda x \rightarrow x) \text{ in } f (f\ 5)$	LET from 5, 7

**Example 2:**  $\text{let } f = (\lambda x \rightarrow x) \text{ in } f(f\ 5)$

This expression is well-formed. This is confirmed by running a Haskell interpreter on the expression, with `Int` as the final type assigned to it.

Second, we insert appropriate types into the skeleton, thus producing a completed typing derivation.

1.	$f : \text{Int} \rightarrow \text{Int}$	$\vdash f : \text{Int} \rightarrow \text{Int}$	VAR
2.	$f : \text{Int} \rightarrow \text{Int}$	$\vdash 5 : \text{Int}$	INT
3.	$f : \text{Int} \rightarrow \text{Int}$	$\vdash f\ 5 : \text{Int}$	APP from 1, 2
4.	$f : \text{Int} \rightarrow \text{Int}$	$\vdash f : \text{Int} \rightarrow \text{Int}$	VAR
5.	$f : \text{Int} \rightarrow \text{Int}$	$\vdash f(f\ 5) : \text{Int}$	APP from 3, 4
6.	$x : \text{Int}$	$\vdash x : \text{Int}$	VAR
7.		$\vdash \lambda x \rightarrow x : \text{Int} \rightarrow \text{Int}$	ABS from 6
8.		$\vdash \text{let } f = (\lambda x \rightarrow x) \text{ in } f(f\ 5) : \text{Int}$	LET from 5, 7

**Example 3:**  $\text{let } f = (\lambda x \rightarrow x) \text{ in } (f\ f)\ 5$

This expression is well-formed. This is confirmed by running a Haskell interpreter, with `Int` as the final type assigned to the expression.

Goal: Does this expression type-check according to the typing rules?

If it does, we should be able to insert an appropriate type environment to the left of “ $\vdash$ ” and an appropriate type to the right of the expression — on each line of the skeleton below.

1.	$\vdash f$	VAR
2.	$\vdash f$	VAR
3.	$\vdash f\ f$	APP from 1, 2
4.	$\vdash 5$	INT
5.	$\vdash (f\ f)\ 5$	APP from 3, 4
6.	$\vdash x$	VAR
7.	$\vdash \lambda x \rightarrow x$	ABS from 6
8.	$\vdash \text{let } f = (\lambda x \rightarrow x) \text{ in } (f\ f)\ 5$	LET from 5, 7

**Example 3:**  $\text{let } f = (\lambda x \rightarrow x) \text{ in } (f\ f)\ 5$

This expression is well-formed. This is confirmed by running a Haskell interpreter, with `Int` as the final type assigned to the expression.

Goal: Does this expression type-check according to the typing rules?

If it does, we should be able to insert an appropriate type environment to the left of “ $\vdash$ ” and an appropriate type to the right of the expression — on each line of the skeleton below.

1.	$\vdash f$	VAR
2.	$\vdash f$	VAR
3.	$\vdash f\ f$	APP from 1, 2
4.	$\vdash 5$	INT
5.	$\vdash (f\ f)\ 5$	APP from 3, 4
6.	$\vdash x$	VAR
7.	$\vdash \lambda x \rightarrow x$	ABS from 6
8.	$\vdash \text{let } f = (\lambda x \rightarrow x) \text{ in } (f\ f)\ 5$	LET from 5, 7

Answer: **NO**, we cannot type-check the expression with the monomorphic typing rules, although we can with the polymorphic typing rules – on the next page.

**Example 3:**  $\text{let } f = (\lambda x \rightarrow x) \text{ in } (f\ f)\ 5$

This expression is well-formed. This is confirmed by running a Haskell interpreter, with `Int` as the final type assigned to the expression.

Goal: Does this expression type-check according to the typing rules?

If it does, we should be able to insert an appropriate type environment to the left of “ $\vdash$ ” and an appropriate type to the right of the expression — on each line of the skeleton below.

- |    |     |   |                                    |          |             |   |   |                   |                   |
|----|-----|---|------------------------------------|----------|-------------|---|---|-------------------|-------------------|
| 1. | $f$ | : | $\text{forall } a.a \rightarrow a$ | $\vdash$ | $f$         | :   | $(\text{Int} \rightarrow \text{Int}) \rightarrow (\text{Int} \rightarrow \text{Int})$ |                   | POLYVAR           |
| 2. | $f$ | : | $\text{forall } a.a \rightarrow a$ | $\vdash$ | $f$         | :   | $\text{Int} \rightarrow \text{Int}$   |                   | POLYVAR           |
| 3. | $f$ | : | $\text{forall } a.a \rightarrow a$ | $\vdash$ | $f\ f$      | :   | $\text{Int} \rightarrow \text{Int}$   |                   | APP from 1, 2     |
| 4. | $f$ | : | $\text{forall } a.a \rightarrow a$ | $\vdash$ | 5           | :   | $\text{Int}$  |                   | INT               |
| 5. | $f$ | : | $\text{forall } a.a \rightarrow a$ | $\vdash$ | $(f\ f)\ 5$ | :   | $\text{Int}$  |                   | APP from 3, 4     |
| 6. | $x$ | : | $b$                                |          | $\vdash$    | $x$   | :   | $b$               | VAR               |
| 7. |     |   |                                    |          | $\vdash$    | $\lambda x \rightarrow x$   | :   | $b \rightarrow b$ | ABS from 6        |
| 8. |     |   |                                    |          | $\vdash$    | $\text{let } f = (\lambda x \rightarrow x) \text{ in } (f\ f)\ 5$ | :   | $\text{Int}$      | POLYLET from 5, 7 |

**Example 4:** `let ones = (1 : ones) in (head ones)`

This expression is well-formed. This is confirmed by running a Haskell interpreter, with `Int` as the final type assigned to the expression.

Goal: Does this expression type-check according to the typing rules?

If it does, we should be able to insert an appropriate type environment to the left of “ $\vdash$ ” and an appropriate type to the right of the expression — on each line of the skeleton below. In this example, we cannot hope to type-check the full expression with the rule `LET`, we must use `LETREC` instead.

1.	$\vdash \text{ones}$	<code>VAR</code>
2.	$\vdash (\text{head ones})$	<code>HEAD from 1</code>
3.	$\vdash 1$	<code>INT</code>
4.	$\vdash \text{ones}$	<code>VAR</code>
5.	$\vdash (1 : \text{ones})$	<code>CONS from 3, 4</code>
6.	$\vdash \text{let ones} = (1 : \text{ones}) \text{ in } (\text{head ones})$	<code>LETREC from 2, 5</code>

**Example 4:** let ones = (1 : ones) in (head ones)

This expression is well-formed. This is confirmed by running a Haskell interpreter, with `Int` as the final type assigned to the expression.

Goal: Does this expression type-check according to the typing rules?

If it does, we should be able to insert an appropriate type environment to the left of “ $\vdash$ ” and an appropriate type to the right of the expression — on each line of the skeleton below. In this example, we cannot hope to type-check the full expression with the rule `LET`, we must use `LETREC` instead.

- |    |                   |   |                    |                |   |   |                    |  |                               |
|----|-------------------|---|--------------------|----------------|---|---|--------------------|--|-------------------------------|
| 1. | <code>ones</code> | : | <code>[Int]</code> | <code>⊢</code> | <code>ones</code>                                   | : | <code>[Int]</code> |  | <code>VAR</code>              |
| 2. | <code>ones</code> | : | <code>[Int]</code> | <code>⊢</code> | <code>(head ones)</code>                            | : | <code>Int</code>   |  | <code>HEAD from 1</code>      |
| 3. | <code>ones</code> | : | <code>[Int]</code> | <code>⊢</code> | <code>1</code>                                      | : | <code>Int</code>   |  | <code>INT</code>              |
| 4. | <code>ones</code> | : | <code>[Int]</code> | <code>⊢</code> | <code>ones</code>                                   | : | <code>[Int]</code> |  | <code>VAR</code>              |
| 5. | <code>ones</code> | : | <code>[Int]</code> | <code>⊢</code> | <code>(1 : ones)</code>                             | : | <code>[Int]</code> |  | <code>CONS from 3, 4</code>   |
| 6. |                   |   |                    |                | <code>⊢ let ones = (1 : ones) in (head ones)</code> | : | <code>Int</code>   |  | <code>LETREC from 2, 5</code> |
