# Semantics of Classical Propositional Logic 

(as opposed to Intuitionistic Propositional Logic)

Assaf Kfoury

January 19, 2017 (adjusted: January 25, 2017)

## some terminology

- the semantics (or formal semantics) of a formal logic $\mathcal{L}$ is sometimes called the model theory of $\mathcal{L}$.
- the model theory of classical propositional logic is defined in terms of Boolean algebras: a model (or interpretation) for the logic is a two-element Boolean algebra, i.e., an assignment of truth-values to the propositional atoms with the standard boolean operations on them ( $\wedge, \vee$, and $\neg)$.
- the standard boolean operations can be defined using truth tables.
- the model theory of intuitionistic propositional logic can be defined in terms of Heyting algebras (also called pseudo-Boolean algebras): a model (or interpretation) is a Heyting algebra.
- every Heyting algebra satisfying the law of excluded middle $a \vee \neg a=\top$ or, equivalently, the double negation law $\neg \neg a=a$ is a Boolean algebra.

## some terminology

- the semantics (or formal semantics) of a formal logic $\mathcal{L}$ is sometimes called the model theory of $\mathcal{L}$.
- the model theory of classical propositional logic is defined in terms of Boolean algebras: a model (or interpretation) for the logic is a two-element Boolean algebra, i.e., an assignment of truth-values to the propositional atoms with the standard boolean operations on them $(\wedge, \vee$, and $\neg)$.
- the standard boolean operations can be defined using truth tables.
- the model theory of intuitionistic propositional logic can be defined in terms of Heyting algebras (also called pseudo-Boolean algebras): a model (or interpretation) is a Heyting algebra.
- every Heyting algebra satisfying the law of excluded middle $a \vee \neg a=\top$ or, equivalently, the double negation law $\neg \neg a=a$ is a Boolean algebra.

## introductory remarks

- for the semantics of classical propositional logic, it suffices to consider the familiar two-element Boolean algebra .
- the two-element Boolean algebra is only one member of the infinite family of Boolean algebras (for more on this topic, click here ).
- the two-element Boolean algebra is not the only way of defining the semantics of propositional logic, e.g., we can use what are called three-valued Kleene algebras to define the semantics of propositional logic (click here ).
- Heyting algebras is not the only way of defining the semantics of intuitionistic propositional logic, e.g., we can use what are called Kripke structures instead (click here and here ).

| $\mathbf{T}$ | $\mathbf{F}$ | $\mathbf{F}$ | $\mathbf{T}$ | $\mathbf{T}$ | $\mathbf{F}$ | $\mathbf{F}$ |
| $\mathbf{F}$ | $\mathbf{T}$ | $\mathbf{T}$ | $\mathbf{F}$ | $\mathbf{T}$ | $\mathbf{T}$ | $\mathbf{T}$ |
| $\mathbf{F}$ | $\mathbf{F}$ | $\mathbf{T}$ | $\mathbf{T}$ | $\mathbf{T}$ | $\mathbf{T}$ | $\mathbf{T}$ |

## a more complicated truth-table

for propositional WFF $(P \rightarrow \neg Q) \rightarrow(Q \vee \neg P)$ :

- start with all the propositional atoms in the WFF
- incrementally, consider each sub-WFF, from innermost to outermost

| $P$ | $Q$ | $\neg P$ | $\neg Q$ | $P \rightarrow \neg Q$ | $Q \vee \neg P$ | $(P \rightarrow \neg Q) \rightarrow(Q \vee \neg P)$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathbf{T}$ | $\mathbf{T}$ | $\mathbf{F}$ | $\mathbf{F}$ | $\mathbf{F}$ | $\mathbf{T}$ | $\mathbf{T}$ |
| $\mathbf{T}$ | $\mathbf{F}$ | $\mathbf{F}$ | $\mathbf{T}$ | $\mathbf{T}$ | $\mathbf{F}$ | $\mathbf{F}$ |
| $\mathbf{F}$ | $\mathbf{T}$ | $\mathbf{T}$ | $\mathbf{F}$ | $\mathbf{T}$ | $\mathbf{T}$ | $\mathbf{T}$ |
| $\mathbf{F}$ | $\mathbf{F}$ | $\mathbf{T}$ | $\mathbf{T}$ | $\mathbf{T}$ | $\mathbf{T}$ | $\mathbf{T}$ |

- propositional WFF $\varphi$ is satisfiable if there is an assignment of truth-values to the propositional atoms which makes $\varphi$ true.
- propositional WFF $\varphi$ is a tautology if every assignment of truth-values to the propositional atoms makes $\varphi$ true.

## a more complicated truth-table

for propositional WFF $(P \rightarrow \neg Q) \rightarrow(Q \vee \neg P)$ :

- start with all the propositional atoms in the WFF
- incrementally, consider each sub-WFF, from innermost to outermost

| $P$ | $Q$ | $\neg P$ | $\neg Q$ | $P \rightarrow \neg Q$ | $Q \vee \neg P$ | $(P \rightarrow \neg Q) \rightarrow(Q \vee \neg P)$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathbf{T}$ | $\mathbf{T}$ | $\mathbf{F}$ | $\mathbf{F}$ | $\mathbf{F}$ | $\mathbf{T}$ | $\mathbf{T}$ |
| $\mathbf{T}$ | $\mathbf{F}$ | $\mathbf{F}$ | $\mathbf{T}$ | $\mathbf{T}$ | $\mathbf{F}$ | $\mathbf{F}$ |
| $\mathbf{F}$ | $\mathbf{T}$ | $\mathbf{T}$ | $\mathbf{F}$ | $\mathbf{T}$ | $\mathbf{T}$ | $\mathbf{T}$ |
| $\mathbf{F}$ | $\mathbf{F}$ | $\mathbf{T}$ | $\mathbf{T}$ | $\mathbf{T}$ | $\mathbf{T}$ | $\mathbf{T}$ |

- propositional WFF $\varphi$ is satisfiable if there is an assignment of truth-values to the propositional atoms which makes $\varphi$ true.
- propositional WFF $\varphi$ is a tautology if every assignment of truth-values to the propositional atoms makes $\varphi$ true.
- $(P \rightarrow \neg Q) \rightarrow(Q \vee \neg P)$ is satisfiable, but is not a tautology.

## another more complicated truth-table

related to the sequent $(P \wedge \neg Q) \rightarrow R, \neg R, P \vdash Q$
shown valid, i.e., formally derivable by the proof rules at the end of Handout 02.

## another more complicated truth-table

related to the sequent $(P \wedge \neg Q) \rightarrow R, \neg R, P \vdash Q$
shown valid, i.e., formally derivable by the proof rules at the end of Handout 02.

| $\mathbf{T}$ | $\mathbf{F}$ | $\mathbf{F}$ | $\mathbf{T}$ | $\mathbf{T}$ | $\mathbf{T}$ | $\mathbf{F}$ |
| $\mathbf{F}$ | $\mathbf{T}$ | $\mathbf{T}$ | $\mathbf{F}$ | $\mathbf{F}$ | $\mathbf{F}$ | $\mathbf{T}$ |
| $\mathbf{F}$ | $\mathbf{T}$ | $\mathbf{F}$ | $\mathbf{F}$ | $\mathbf{T}$ | $\mathbf{F}$ | $\mathbf{T}$ |
| $\mathbf{F}$ | $\mathbf{F}$ | $\mathbf{T}$ | $\mathbf{T}$ | $\mathbf{F}$ | $\mathbf{F}$ | $\mathbf{T}$ |
| $\mathbf{F}$ | $\mathbf{F}$ | $\mathbf{F}$ | $\mathbf{T}$ | $\mathbf{T}$ | $\mathbf{F}$ | $\mathbf{T}$ |

- when all the premises (shaded in gray ) evaluate to $\mathbf{T}$, so does the conclusion (shaded in green)
- in such a case we write $(P \wedge \neg Q) \rightarrow R, \neg R, P \models Q$

## soundness and completeness

## soundness and completeness

- If, for every interpretation/model/valuation (i.e., assignment of truth values to the propositional atoms) for which all of the WFF's $\varphi_{1}, \varphi_{2}, \ldots, \varphi_{n}$ evaluate to $\mathbf{T}$, it is also the case that $\psi$ evaluates to $\mathbf{T}$, then we write:

$$
\varphi_{1}, \varphi_{2}, \ldots, \varphi_{n} \models \psi
$$

and say that " $\varphi_{1}, \varphi_{2}, \ldots, \varphi_{n}$ semantically entails $\psi$ " or also "every model of $\varphi_{1}, \varphi_{2}, \ldots, \varphi_{n}$ is a model of $\psi$ ".

## soundness and completeness

- If, for every interpretation/model/valuation (i.e., assignment of truth values to the propositional atoms) for which all of the WFF's $\varphi_{1}, \varphi_{2}, \ldots, \varphi_{n}$ evaluate to $\mathbf{T}$, it is also the case that $\psi$ evaluates to $\mathbf{T}$, then we write:

$$
\varphi_{1}, \varphi_{2}, \ldots, \varphi_{n} \models \psi
$$

and say that " $\varphi_{1}, \varphi_{2}, \ldots, \varphi_{n}$ semantically entails $\psi$ " or also "every model of $\varphi_{1}, \varphi_{2}, \ldots, \varphi_{n}$ is a model of $\psi$ ".

- Theorem (Soundness):

If $\varphi_{1}, \varphi_{2}, \ldots, \varphi_{n} \vdash \psi$ then $\varphi_{1}, \varphi_{2}, \ldots, \varphi_{n} \models \psi$.

## soundness and completeness

- If, for every interpretation/model/valuation (i.e., assignment of truth values to the propositional atoms) for which all of the WFF's $\varphi_{1}, \varphi_{2}, \ldots, \varphi_{n}$ evaluate to $\mathbf{T}$, it is also the case that $\psi$ evaluates to $\mathbf{T}$, then we write:

$$
\varphi_{1}, \varphi_{2}, \ldots, \varphi_{n} \models \psi
$$

and say that " $\varphi_{1}, \varphi_{2}, \ldots, \varphi_{n}$ semantically entails $\psi$ "
or also "every model of $\varphi_{1}, \varphi_{2}, \ldots, \varphi_{n}$ is a model of $\psi$ ".

- Theorem (Soundness):

If $\varphi_{1}, \varphi_{2}, \ldots, \varphi_{n} \vdash \psi$ then $\varphi_{1}, \varphi_{2}, \ldots, \varphi_{n} \models \psi$.

- Theorem (Completeness):

If $\varphi_{1}, \varphi_{2}, \ldots, \varphi_{n} \models \psi$ then $\varphi_{1}, \varphi_{2}, \ldots, \varphi_{n} \vdash \psi$.

## soundness and completeness

- simple version of soundness: if $\vdash \psi$ then $\models=\psi$

Informally, "if you can prove it, then it is true".

- simple version of completeness: if $\models \psi$ then $\vdash \psi$

Informally, "if it is true, then you can prove it".

- if $\models \psi$, then we say $\psi$ is a tautology.
- if $\vdash \varphi$, then we say $\varphi$ is valid or a (formal) theorem.
